

Risks and Results

Broadband brought us new and previously unattainable speeds. With it came “always on” connections. So what did we do? We opened a permanent, enormous bore pipe with high data transfer rates. With all the security measures in place and firewalls ablaze, how long do you think it will be before something sneaks in? This has already happened to one customer. A virus wiped out all his database files. Luckily he was one of our customers - and we had him running again within 3 days.

Modern security software is good but, very rarely, it fails. It's a risk. Physical factors such as mechanical breakdown are also rare, but still happen. No-one is responsible for your data, except you. Fire and flood are rare too. But the question remains - if, something disastrous should happen, from a motor fail in a drive, to a major fire or flood, they are risks - would you be able to recover your files and data?

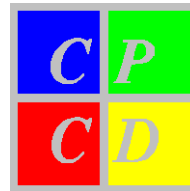

Anyway, I downloaded this file and—oh no. What's your email again? I must have lost it. Oh@#*%!!

Prevention is better than cure. With a proactive attitude to Data Security, you will relax — knowing that your most important data is safe from loss.

Peace of mind is priceless, but it need not cost the earth.

Even if you think you have backups under control, we strongly advise you think again - imagine sorting through a pile of Zip Disks only to find that one is missing or a few are corrupt.

Data Security and Backups:

Could You Recover If the Worst Happened?

Just How Bad Could it Be?

Almost all PC users have files that, at best, are valuable and, at worst, they depend on. Home users have pictures and, with the advent of digital photography, no recourse to negatives. Bank statements and downloaded music may be important to you, as may downloaded programs with those activation keys, which are near impossible to replace. Wedding pictures, holiday snaps, whatever... where would you be without them? If you can honestly say that you could lose them without worry, then you probably don't need backups.

Business users are different. Accounts, VAT records, Customer Details, invoices, statements - I could go on. Pretty much all of your essential business records are electronic and, as we progress through this neo-digital era, this format of data recording will only increase. According to studies, 60% of Companies who suffer catastrophic data loss, or unavailability for a period of 10 days, go bankrupt. Another cites that after a fire, only 10% ever open for business again. It's quite a sobering concept. After all—who can put a true value on your business?

Beat the Risks — be Prepared

What Can Be Done to Help?

Given that you are aware of the need for good Internet Security software, ensuring you have a capable backup system is very simple in most cases, and not even expensive.

For most people, ensuring they have a DVD writer is enough. We can also supply software that can recover your data in minutes from a hidden part of your disk. Many choose an external Hard Drive, connected by a USB cable. More dependent or careful customers may choose a network storage facility. We supply and install Fire Safes for data. Small, secure backups can be achieved using Flash drives, and even installing a secondary hard drive may be your answer. Very few, if any, will need a server or tape backup. Remote backup services may also be considered. DVD and hard drive application technology has simplified backing up enormously. With our help, and some education and care, together we can ensure that your data is yours forever.

Each case is individual and all possible outcomes are considered. This consultation service is undertaken for FREE.

Advice is Always Free — Take it

How Much Will It Cost?

Software Hard Drive Recovery System

If used correctly, restores your drive exactly to an earlier date, by imaging.

Can also produce bootable recovery media for HDD failure. ...From **£45**

External Hard Drive Recovery USB 160Gb

If used correctly, restores your drive exactly to an earlier date, by basic, secondary storage discrete from your machine.From **£80**

Network Storage

Discrete, secure network storage, anywhere on your network, even wireless.

.....From **£109**

Secondary Hard Drives

A spare Hard Drive, internal. A great back-up.

.....From **£60**

DVD Writers

Fitted and including software and a starter pack of disks.

...From **£40**
